

TORRENT® Universal Mounting Kit

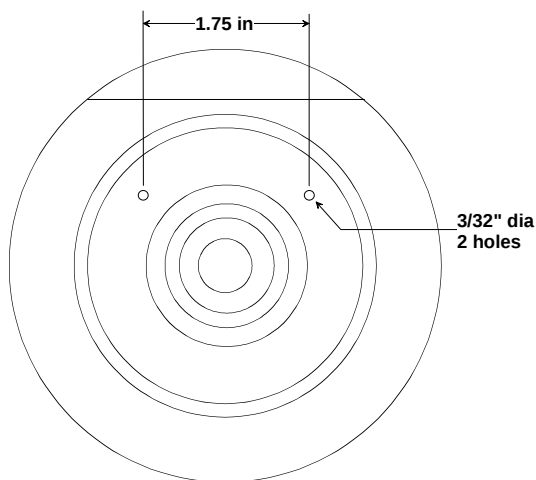

The Universal Mounting Kit consists of a sturdy and durable powder-coated aluminum bracket upon which the TORRENT Rain Gauge is attached. It allows the level mounting of weather sensors to either a pole (metal TV antenna mast, or ¾" PVC pipe) or a vertical wall (or fence post).

A pair of u-bolts are provided for attachment of the bracket to a pole. In addition, three screws are provided for attachment to a vertical wall or fencepost.

Instructions for Installation

First, determine whether you will utilize the u-bolts for pole mounting, or the screws for wall mounting. Second, decide which side of the bracket to install the rain gauge (for example, it's easier to use a screwdriver to mount the bracket if the screws are below the rain gauge, instead of behind it). Third, install the rain gauge on the bracket, using a phillips screwdriver and the two screws provided, in two 3/32" holes drilled 1 ¾" apart (see sketch below).

Finally, attach the bracket to the pole, wall, or fence post. Take care to mount the bracket so that the rain gauge will be level.
